Bizagi + SAP: Why Integrate?

Adding value to your ERP through Digital Process Automation

As a central system of record, SAP's capabilities and power are beyond doubt. But does SAP manage all your end-to-end processes the way you want? Are you able to make process changes quickly and easily and at an acceptable cost?

5 signs you need to complement your SAP with DPA

- **It's expensive to extend**, integrate, and upgrade your customized SAP.
- **Your IT department is overburdened** with SAP modification requests, leading to delays in business critical projects.
- **You need to be more agile** to manage regulatory changes or keep up with customer expectations
- **Mobile and cloud apps** need to be connected as part of your infrastructure
- **Lack of visibility** into SAP's data structures and sequences make it hard to make productive changes

Bizagi can add value to SAP

- **Collaboration between business and IT**

  Business and IT teams can collaborate more effectively through a single, low-code platform, which encourages effective teamwork. Plus, business users can implement changes themselves to free up resources for the IT team.

- **Easily create custom applications**

  The rigid SAP system can make it difficult to build specific processes. Bizagi's visual models make it easy to set up the required touchpoints with the SAP systems. So, you can make flexible changes that would be impossible using SAP alone.

- **Save time and money**

  It can be inefficient to update processes in SAP as they often require information from external systems. Bizagi acts as a process orchestrator, connecting all the different data points without replicating the data itself. This results in seamless integration, so the business can adapt quickly and cost-effectively.

- **Ensure compliance**

  With ever-changing rules and regulations, it can be hard to ensure that your systems are up to date. The ability to edit processes in Bizagi means you can quickly respond to any regulatory changes and keep your system secure and compliant.

- **Optimize mobile views**

  Today's users want to be able to work on the go. Bizagi improves the user journey with optimal display on any device, and only displays the necessary information to complete the task – an essential feature for time-pressed business users.

Bizagi: Your Enterprise Orchestrator

As your business grows, your systems will expand. Bizagi acts as an orchestrator to connect people, applications, devices and information across your organization on one secure and scalable digital transformation platform. Not only that, it delivers an easy-to-use interface that allows business users to visualize all their processes and implement the process change with minimal coding.
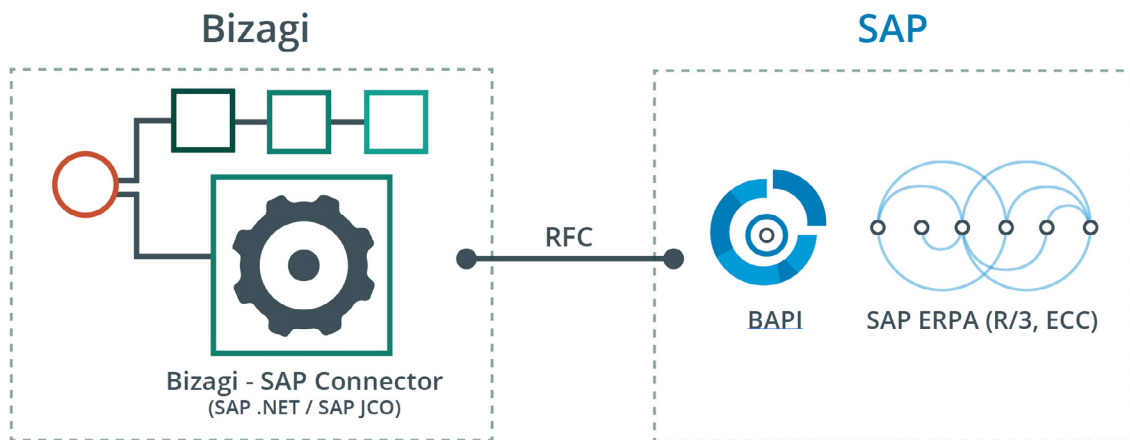

Bizagi can connect SAP business transactions with other applications or processes in a matter of weeks. There's no need to replace your previous ERP investments, you can leverage them instead. With the agile process layer wrapped around your SAP application, you gain easy and cost-effective connectivity, delivering real-time access to information directly from the process, or vice versa.

This, in turn, helps you to deliver an exceptional customer experience, reduce costs, and optimize business performance.

Bizagi SAP Connector and Web Services

This out-of-the-box integration with SAP NetWeaver connects directly to SAP from Bizagi so business users can configure all the touch points between their processes and the SAP system.

You configure your processes to invoke BAPI wrappers to either query, create or update records directly in SAP. Choose either to activate a button's click in the user interface; through asynchronous task handling timeouts; or a pre-set number of automatic retries. The SAP connector authenticates directly with an authorized SAP user, instead of delegating security to your web service setup.
